Project 2 Summary

The web app is an online marketplace for people to buy and sell shoes. This website contains many features; including, a monthly featured custom shoe and the artist, the ability to search and view specific shoes, the ability to create a listing, and the ability to log in. The audience is anyone who wants a reliable and fair online site to buy and sell shoes.

From Project 1, I have learned about the importance of labeling your pages and detailed text. For example, poorly detailed text was pointed out on my create listing page. I included a vague label that could confuse users. The recommendation was followed and the label was changed. I did not add titles to some of the pages because I felt that titles would add an awkward element. Adding a sorting combo box was suggested on the search result page. The suggestion was agreed upon and added to the new design. There are a few differences between the redesigned wireframes from Project 1 and the coding results. I changed the last two buttons in the navigation bar from “Sign In & Add listing” and “Cart” to “Add listing” and “Login” respectively. Since Project 2 did not involve javascript I felt that these changes were suitable to be able to access all HTML pages. On the search page, I aligned the search bar to the left. In addition, the image carousel was not fully implemented due to no JavaScript.
